

POWER SWITCH PANEL PA18/10

The PA18/10 comprises a triple-pole-and-neutral fuse-switch and associated metering equipment. The switch is conventional in design and is housed in a separate compartment in the panel. It is operated by a handle concealed behind a hinged panel. The panel must be opened and the handle pulled out to bring it to a working position. Access to the switch mechanism is via a door with a Castell lock. The door cannot be opened until the

switch is open and only then can the key be removed from the lock. Conversely the switch cannot be made until the door is closed and the key turned in the lock.

Metering equipment on the output side of the switch comprises an ammeter, a voltmeter and meter-selector switches.

Also see information applying to parent equipment EP13/2.
